

ELECTROENCEPHALOGRAM-EEG

Overview:

EEG or Electroencephalogram is a test that records electrical activity of the brain and brain wave patterns.

Pre Preparation:

- Your scalp needs to be oil-free for a clear recording.

During Procedure:

- The technologist will check your scalp to see whether its oil free.
- You must remove your ornaments / accessories / purse / belt etc.
- You will be required to lie on the bed.
- Technologist will place electrodes on your head after cleaning the areas with gel.
- Doctor might administer mild sedatives, if necessary.
- You should close your eyes & relax while the procedure is being conducted.

- This procedure is absolutely painless.

- The technologist will ask you to do different things at different times during the EEG. He or she might have you look at a flashing light or breathe in and out deeply and quickly.

- The technologist will monitor you through the console, while the test is conducted.

- Post the test, the electrodes will be removed and excess gel will be wiped off your scalp with cotton and tissues.

Post Procedure:

- After procedure, you can resume your daily routine activities.
- The report will be issued in an hour, post procedure, at the reception.
